---------------------	-----------

Unit Standard	73-75
----------------------	--------------

1. Introduction

This learning program is part of a complete qualification. For more details concerning the complete qualification please contact your service provider or alternatively the office of the SASSETA

2. Purpose of this learning program

The person credited with this unit standard will be able to identify and determine the type of an emergency and assist with the evacuation of people during the emergency. The person will also be able to respond to and use emergency signals within their own area of responsibility.

The qualifying learner will be capable of:

- ♦ Identifying the emergency situation.
- ♦ Assisting with an evacuation drill.
- ♦ Responding to emergency signals in own area of responsibility.

2.1 Target group

This program is compiled for the following **target group**:

- Security members
- South African Defense Force members
- South African Police Force members
- Correctional Services
- Individuals who wishes to complete the NQF level 3 National Certificate in security practices.

3. Standards and qualifications

It is important that you as the learner understand and realize that this training program is not presented in isolation, but that it was developed based upon nationally recognized standards known as unit standards.

Unit standards are the “building blocks” of qualifications. All qualifications are plotted on the National Qualifications Framework (NQF).

Unit standards comprises of outcomes. An outcome is a statement that describes the required competency that must be demonstrated by the learner on successful completion of a training intervention.

4. Assessments

In order to assess whether a learner can actually demonstrate the desired outcomes, assessment criteria are included in the unit standard. Each outcome has its own set of assessment criteria.

REMEMBER.....

The assessment criteria describe the evidence that is needed that will show that the learner has demonstrated the outcome correctly.

Kindly refer to the unit standard attached hereto for the assessment criteria.

It is of utmost importance that the learner fully understands the assessment criteria as listed in the unit standard, as it is the only way in which the learner will know what he will be assessed against.

The **final or summative assessment** is the most important aspect of this training program. It is during this process that the learner will be declared competent or not yet competent.

The learner will know exactly how he will be assessed, and when and where he will be assessed. All of these details must be obtained from the training provider where the learner enrolled for his program.

5. Range statements

REMEMBER.....

Also included in the unit standard are the range statements in support of the assessment criteria.

The range statements indicate detailed requirements of the assessment criteria.

6. The learning guide

The learner guide is included in this material under various learning units. The learner guide has been designed in such a manner that the learner is guided in a logical way through the learning material and requirements of the unit standard.

On completion of this skill program, the learner will be assessed against the assessment criteria as stipulated in the unit standard.

Each of the modules consists of learner outcomes to be achieved during training and development interventions, work related experience or at your own time. The learner outcomes will enable you to achieve the required level of confidence and competence in order to undergo the summative (final evaluations) assessment.

The learner needs to assess his own knowledge and skill throughout the training process by completing the learner workbook. With the completion of the workbook you start collecting evidence to proof your competence. The learner workbook will be assessed (FORMATIVE ASSESSMENT)

TAKE NOTE

The learner guide will remain the property of the learner once the LEARNING PROGRAM has been completed.

TAKE NOTE

- The best results will be obtained if you start with Study Unit 1 in the Learner Guide, and work your way through it, study unit by study unit.
- All learning outcomes are vital and must be studied (and exercised for all practical requirements) thoroughly to ensure that enough evidence for all specific outcomes is generated.

7. Learning assumed to be in place

It is assumed that a learner which registers for this program have completed a program in communication at NQF Level 3 or equivalent.

It is imperative to understand that this program are only one of the building blocks to complete Skills program 1 The complete list of unit standards for Skills program appears on the next page.

7.1 Security program matrix

SKILLS PROGRAM 1: SASSETA E			
244177	Conduct a security patrol in area of responsibility	Level 3	7 Credits
244184	Apply legal aspects in a security environment	Level 3	8 Credits
244176	Use security equipment	Level 2	2 Credits
244179	Handle complaints and problems	Level 3	6 Credits
244181	Perform hand over and take over responsibilities	Level 3	2 Credits
244182	Give evidence in court	Level 3	4 Credits
12484	Perform basic fire fighting	Level 2	4 Credits
116534	Carry out basic first aid treatment in the workplace	Level 3	2 Credits

Patrol Security officer/Grade E

SKILLS PROGRAM 2: SASSETA D			
244189	Conduct access and egress control	Level 4	7 Credits
242825	Conduct evacuations and emergency drills	Level 4	4 Credits
11505	Identify, handle and defuse security related conflict	Level 4	12 Credits
117705	Demonstrate knowledge of the Firearms Control Act 2000 (Act No. 60 of 2000)	Level 3	3 Credits
113924	Apply basic business ethics in a work environment	Level 2	2 Credits
119465	Write/present/sign texts for a range of communicative contexts	Level 3	5 Credits
114979	Operate a computer workstation in a business environment	Level 3	2 Credits

Access control officer/Grade D

SKILLS PROGRAM 3: SASSETA C			
113909	Coach a team member in order to enhance individual performance in work environment	Level 3	5 Credits
13912	Apply knowledge of self and team in order to develop a plan to enhance team performance	Level 3	5 Credits
244578	Describe how to manage reactions arising from a traumatic event	Level 3	2 Credits
113852	Apply occupational health, safety and environmental principles	Level 3	10 Credits
13936	Outline the legal environment of a selected industry	Level 3	2 Credits
119472	Accommodate audience and context needs in oral/signed communication	Level 3	5 Credits
11983	Compile and administer a case docket for investigation purposes	Level 5	6 Credits

Asset & reaction officer/Grade C

8. Preparation of summative assessment

After you have worked through the **LEARNER GUIDE** and you are satisfied that all theoretical and practical requirements/ evidence, as stipulated by the UNIT STANDARD, can be met, you need to make your own necessary arrangements with the assessor and/ or facilitator. The training establishment will then arrange a suitable date for you to attend your pre-assessment meeting and then arrange for a suitable date to complete the final assessment.

8.1 RPL assessment

The assessment of RPL learners will be conducted in the same way as for those of new learners. The assessment pack is exactly the same and will therefore be used for new learners as well as RPL Learners. It must however be noted that learners who are applying for RPL must provide proof of previous learning and subject related experience prior to the assessment.

This proof or evidence can be in the format of certified copies (certificates) of previous learning programs that have been attended.

All the evidence will be assessed and authenticated before a learner will be allowed to enroll for an RPL program.

9. Roles and responsibilities

9.1 Facilitator/instructor

- Prepare to facilitate.
- Transfer of knowledge and skills

9.2 The role of the assessor

- Plan for the assessment
- Prepare the learner for the assessment

9.3 The role of the Learner

- Prepare for assessment.
- Accept the responsibility of learning.
- Accept the responsibility to produce/deliver evidence.

STUDY UNIT 1

The nature of emergencies

LEARNING OUTCOMES

On completion of this study unit the student will....

- ♦ Define an emergency
- ♦ Explain the role of the security function in emergency planning.
- ♦ Explain the goal of emergency and disaster planning.
- ♦ Explain why a need for emergency plans exist in organizations.
- ♦ Explain the steps in the emergency planning process
- ♦ Understand the role of security in preventing emergencies.
- ♦ Explain the basic risk assessment process during and before an emergency.

1. Introduction

Emergencies generally do not take place in organizations on a daily basis, and is in most instances not the first priority of any security organization. Crime and other security related aspect normally takes priority to emergency planning and is only slotted into the security organization as an add-on after proper attention has been given to other matters. Taking into consideration that security is generally regarded as the main role player during emergency incidents, it has become time that security leaders focus their attention also to secondary security aspects, like emergency planning, to ensure a holistic approach to security management. Although it is not generally expected of first line security managers to draft emergency plans, it is important though that they understand what emergency planning consist of, as well as the role security play in the operational execution of emergency plans.

First line security managers must understand the operational role expected of them throughout the emergency planning process, from the conceptualization of the plan, until the execution of the plan, either in the event of schedules tests, or during a real emergency. This chapter will provide a step by step approach to guide the first line security ,manager through the various steps of an emergency plan, the identification and anticipation of emergency threats, as well as the elements of a basic emergency plan.

2. What is an emergency, and why the need for emergency plans?

DEFINITION

By definition emergencies are incidents of sudden crisis or catastrophe, often appearing without warning and demanding prompt reaction. Mackenzie et al (1983:74) provide three distinct definitions namely;

- ♦ **Emergency:** a sudden state of affairs needing prompt action;
- ♦ **Crisis:** a time of acute danger or suspense; and
- ♦ **Catastrophe:** a great and sudden disaster.

2.1 Emergency

An “Emergency” is an unexpected event. This event may or may not be potentially fatal, but it needs dealing with immediately. However you are a Security officer. Your job is to expect the unexpected and deal with the situation effectively. As you will see from the list below there are many different types of emergency each of these will require a different response.

EXAMPLE:

- ♦ Accident
- ♦ Armed Robbery
- ♦ Bomb Threat
- ♦ Fire
- ♦ Flood
- ♦ Natural Disaster
- ♦ Medical
- ♦ Terrorist Attack

DEFINITION

Jenkin (1987:1) described a disaster as "...an emergency event that occurs with little or no warning and that causes more destruction or disruption of operations than the organization can correct by applying its own resources". This definition implies that, while internal staff should be able to take all necessary action in the case of any minor emergency incident, the onset of disaster will call for urgent outside assistance.

IMPORTANT**First things first!**

Emergencies can happen at any time in any place. They don't wait for you to complete your training or induction before they occur. This is why it is vital the first thing you do when you arrive at a site, is make sure you find out exactly what you are expected to do in an emergency. You also need to know how to turn off the Gas, Water, Electrics, plus the location and type of any hazardous substances.

2.2 Crisis

Any event or occurrence that has taken place and has seriously impaired or halted the operations of a site.

In some cases, mass casualties and severe property damage may be sustained. The effects of the emergency are wide-ranging and complex. A timely resolution of disaster conditions requires complete cooperation and extensive coordination with external jurisdictions.

During a crisis, the supervisor will notify the site manager who will notify the emergency team members. A emergency operations center will be established on the site to evaluate the situation and decide upon a course of action.

Should the site not be accessible due to the nature of the emergency, an operation centre can be established at a nearby location.

EXAMPLE:

Some examples of a crisis include but are not limited to:

- ◆ major flooding
- ◆ major earthquake,
- ◆ and/or a massive release of a chemical agent
- ◆ terrorist activity.

2.2 Catastrophe/Disaster

Disasters are events that occur when significant numbers of people are exposed to extreme events to which they are vulnerable, with resulting injury and loss of life, often combined with damage to property and livelihoods.

Disasters, commonly leading to emergency situations, occur in diverse situations in all parts of the world, in both sparsely populated rural and densely populated urban regions, as well as in situations involving natural and man-made hazards.

Disasters are often classified according to their speed of onset (sudden or slow), their cause (natural or man-made), or their scale (major or minor).

An example of disasters may include but are not limited to.....

- ♦ A train carrying fuel was derailed and leaking fuel was ignited by electrical cables, causing an explosion.
- ♦ Oil spilled on a sea carrier washing out on beaches.
- ♦ flood waters through the town, killing hundreds of people (Parker & Mitchell, 1995).

Mackenzie et al. (1983:74) also write as explanation for the need for emergency plans that:

Security concerns itself particularly with those emergency incidents which pose a direct and immediate threat to human life and property. There are in most business and domestic communities special emergency services trained to fight fires, to handle terrorists and to save lives. **No matter how effective such services may be, there will always be a lag between the moment when a disaster or emergency occur and the time when the community emergency services can take effective action.** During this critical period chaos and panic may reign, fires can spread and injured people can bleed to death.

Based on this statement emergency plans for organizations are essential as immediate response to all emergencies, and for emergencies with enormous proportions, until such time that qualified and advances support can take control.

3. The role of the security component in emergency planning

It is generally excepted in organizations that the security leader is the main role player in emergency situations and incidents. Like safety professionals, security professionals should always be involved with emergency planning, and in most situations a representative from the security component is part of the planning committee. In practical terms in many companies the emergency organization is build around the existing security force (Berger 1979: 169).

Whether the security component is principally responsible for emergency situations or not, security will either be responsible for, or have specific roles in any emergency management function. The security leader, who should logically be the developer of the plan, will identify the following:

- ♦ Purpose and objectives;
- ♦ Major preventative, anticipatory, and response functions;
- ♦ Responsibilities assigned to particular positions;
- ♦ Interfaces with outside response agencies, such as police and fire departments;
- ♦ Equipment required; and
- ♦ An approach for bringing various elements of the plan together to form a synchronous whole (Fennely 2004:282)

According to Fennely (2004: 282) developing a plan is more than just putting pen to paper. The plan is the product of a logical planning process. A model that works well in ensuring that the planning process is successful, has the following sequential steps or phases that occur in a cycle:

Deciding a general strategy

1.

This step is aimed at assessing the organization's vulnerabilities, as well as the probability of specific emergencies taking place.

Prepare a plan that incorporates actions consistent with strategy .

2.

This step is aimed at assigning responsibilities, describing resources and identifying procedures to be carried out during an emergency incident.

Implement the plan

3.

This step is aimed at drafting a full set of implementing procedures for each potential incident. The security professional will not be able to predict and plan for each scenario, but by drafting procedures for broad scenarios it can be adjusted to meet specific needs.

Test the plan

4.

This step is aimed at testing the plan by full ,or partial implementation against a specific predetermined scenario.

Evaluate the results

5.

This step is aimed at the objective assessment of the completed test, with the purpose of modifying the plan against the lessons learnt during the test. (Fennely 2004:282-283)

4. The role of security in preventing emergencies

According to Jenkin (1987:4) irrespective of the size of the institution, the first priority in planning for emergencies and disasters should be...

- ♦ for an inspection to be made of the premises, inside and out, and of the immediate adjacent surroundings, with prevention as a major aspect of the aim of the inspection.

This initial inspection(s) should be done by the security professional, supported by role players identified as experts of specific areas and processes within the organization.

For example the security manager, supported by the plant manager, should together inspect the plant and its surroundings so as to ensure that all potential risks, as well as the ways how to prevent the risks, are identified.

Based on the initial inspections, and in continues consultation with the organizational experts, inspection lists can then be drafted with the aim of preventing incidents, accidents and emergencies. The focus of inspection lists should be organizational wide, and be a holistic approach to address all potential emergencies. Inspection lists, as part of a preventative approach, should deal for example with aspects including fire, flood, security, storage facilities, and surly in the South African environment, with occupational health and safety aspects (This aspect will be dealt with in chapter.....). The overall number of items which will need to be included under the heading of prevention in any emergency plan will be determined by the circumstances of the organization concerned, as well as the nature and complexity of its business activities.

As a preventative strategy for emergencies, the security professional should continuously assess and modify inspection list to conform to the changing organizational environment, as well as to ensure that list are still relevant to the risks influencing on the organization. It is the responsibility of the security professional to ensure that scheduled inspections are done according to the applicable "prevention check lists", and that any deviations are reported and followed up. Checklists, as a preventative approach by security professionals, have not yet been utilized to it's full potential, but can surely play a positive role to prevent emergencies.

5. The goal of emergency and disaster planning

Any company or organisation can be confronted with an emergency incident, whether caused by a localised work related accident, or a major disaster caused by fire or other related natural disasters. No company or organization can consider itself immune and therefore it is managements responsibility to ensure that the organisation is prepared to meet any emergency that might reasonably strike.

Emergency and disaster plans are integrally designed to fulfil managements responsibility to meet the potential threats caused by accidents, fire and other threats. The purpose of disaster and emergency plans are to anticipate what can happen to the company or organization, and to be able to promptly and effectively respond to such incidents.

The goal of emergency planning is thus threefold:

- ♦ To ensure the safety of people. Not only employees, but all persons directly or indirectly connected to the organisation or company at the moment of the incident;
- ♦ The protection of property, with minimum loss or damage; and.
- ♦ The restoration of normal operations with minimum delay (Berger 1979:157).

6. Risk assessments and emergencies

According to Berger (1979: 160) security professionals should, as in all security planning start with risk assessments. By asking various questions the security professional will gain insight towards the potential threat his/her company might be exposed to, and thus draft plans on how to limit or avoid any impact the emergency might have on the company or organisation.

Research into catastrophic events has shown people with a plan are far more likely to survive! It is you always carry out a "Dynamic Risk Assessment" (DRA)

What is a DRA?

In reality we continuously live in the margins of life and death.

For example if you walk on a pavement you are probably less than a couple of meters from potential catastrophe; similarly if you drive a car.

Therefore a DRA is a continuous process which we do without thinking to help us deal with potentially life threatening situations. Every step you take, your surroundings change, people, places, etc. Things which were not a threat become so and other threats retreat into the distance.

The DRA IS bringing the Risk Assessment process to the working environment.

6.1 The “WWW.SAFE” Protocol!

Using the following protocol will help get you thinking in the right kind of way. It is a tool to remind you of the things you need to consider in dealing with any situation, emergency or not.

- ♦ **Stop:** There is a saying, “...only fools, rush in...” make sure you are not a fool. Just because you are a trained security officer does not mean you now have super powers! You playing the hero to save one person, may cost other people their lives. In fact, you could easily become a danger to everyone around you.

The most important thing to do is to make sure you are safe - as you are one of the few who will know how to keep the others safe.

You are no use to anyone dead!

- ♦ **Assess:** Consider all of the following:
 - ⇒ **W = What:** What has happened; what is happening; what objects are available, to you or them.
 - ⇒ **W =Where:** Where are you; what are your surroundings; is it light; is it dark, where are the entrances; where are the exits; where can you hide; where should you tell people to go.
 - ⇒ **W = Who:** Who are you dealing with; Is there more than one; Are they safe; Are they unconscious, How big are they; Will you need help?
- ♦ **Find a Solution:** You must try to create a, win – win, situation whenever possible. The best way to do this is too look and listen. Focus on giving everyone the best service you can. However, you must never make a promise you cannot personally deliver. Make sure you know your limitations – do not hesitate to ask for help. Once again the more you practice, the more solutions you will have available.
- ♦ **Exit Safely:** Remember you are responsible for everybody’s safety – good or bad. Therefore, have an exit plan in place. This plan should be simple and effective and easily explained. It should cover everything, from an upset customer, to terrorist at-tack. Fortunately, many places have policies and procedures, which cover, these events. However, if not it is up to you to work out your own plan to make sure you get home at the end of each day.

TAKE NOTE

The easiest way to remember this is as
www.safe:

What – Where – Who – Stop – Assess - Find a
solution - Exit safely

[illegible]

STUDY UNIT 2

Types of emergencies

LEARNING OUTCOMES

On completion of this study unit the student will....

- ♦ Identify the broad categories of emergencies.
- ♦ Define an earth quake
- ♦ Explain the procedure to be followed during an earth quake.
- ♦ Define a flood
- ♦ Explain the procedure to be followed during a flood
- ♦ Define an explosion
- ♦ Explain the procedure to be followed during a explosion.
- ♦ Define an chemical spill
- ♦ Explain the procedure to be followed during a chemical spill.
- ♦ Define an fire
- ♦ Explain the procedure to be followed during a fire.
- ♦ Explain the procedure to be followed when receiving a bomb threat.
- ♦ Explain the procedure to be followed when a suspicious package have been found.
- ♦ Explain the procedure when dealing with a hostage taker.

1. Types of emergencies

As part of the risk assessment companies should draft a “list” of emergencies that they have identified, as well as the impact the various emergencies might have on the company. Generically emergencies can be divided in three broad categories of emergencies namely:

- ♦ **Natural disasters:** This category is normally referred to as “acts of God” and include earth quacks, floods, lightning, tornado’s and wild fires.
- ♦ **Abnormal incidents or accidents:** This category refers to incidents caused by human error and include the following; explosions, industrial accidents, chemical spills etc.
- ♦ **Intentional threats:** This category refers to incidents caused by intentional human acts, and include for example the following; riots, industrial action, terrorism, bomb and bomb threats as well as hostage situation (Du Preez 1990:359).

2. Procedures dealing with natural disasters

2.1 Earth quacks

An earthquake is a tremor of the earth's surface usually triggered by the release of underground stress along fault lines. This release causes movement in masses of rock and resulting shock waves.

Here are some tips of what to do during an earthquake:

- ♦ Do NOT go outside. You could get hurt from falling glass or parts of buildings. If you are outside, stay away from buildings and power lines.
- ♦ Take cover under a desk, table, or other large and stable piece of furniture. Hold on to it. Or, stand in a doorway and brace yourself.
- ♦ Stay away from windows, heavy furniture, appliances, mirrors, pictures, and anything else that could fall and hurt you. Also stay away from fireplaces. You could lose your balance and hurt yourself on the fire.
- ♦ If you are driving when an earthquake happens, stop the car if it's safe. Stay inside your car until the earthquake stops, and don't drive near bridges or tunnels. Try not to stop by power lines, light posts, signs, or trees. These could fall and hurt you.
- ♦ Stay alert for falling objects. Most people get injured by falling objects during an earthquake, not by the shaking itself.
- ♦ Do NOT use matches, lighters, or candles. If there is a broken gas line, you could spark a fire or explosion.
- ♦ Do NOT use elevators. There might be a power outage due to the earthquake, and you could get stuck in the elevator.

After the earthquake stops, here's what you should do:

- ♦ Check yourself and others for injuries. Call the local emergency number 10111 if you or someone else needs immediate medical assistance. If the phone lines are not working, try using a cell phone.
- ♦ Check to see if electric, water, and gas lines are damaged. If they are, shut off the valves. If you smell gas, find out what to do.
- ♦ Stay away from damaged buildings and areas. You could get hurt by broken glass and falling objects.
- ♦ Listen to the radio for more information.

2.2 Floods

DEFINITION

Flooding is a natural and recurring event for a river or stream. Flooding is a result of heavy or continuous rainfall exceeding the absorptive capacity of soil and the flow capacity of rivers, streams, and coastal areas. This causes a watercourse to overflow its banks onto adjacent lands.

When flooding happens, here's what you should do:

- ♦ Go to higher ground immediately.
- ♦ Do NOT try to drive through water, even if it's not moving. Your car can easily get swept away.

3. Procedures dealing with abnormal incidents and or accidents

3.1 Explosions

DEFINITION

An "effect" produced by a sudden violent expansion of gases. Some "effects" of an explosion are loud noise and shock waves, which can collapse walls and shatter windows.

If the building you're in is collapsing or there's an explosion, here's what you should do:

- ◆ Leave as quickly as possible.
- ◆ Stay calm.
- ◆ Do NOT use elevators. The power might go out, and you will be stuck.
- ◆ Take your emergency kit with you if you have time.
- ◆ If you can't get out of the building, go under a stable piece of furniture, like a table or desk.

If you get trapped by debris, here are some tips to stay alive:

- ◆ Try not to move around too much. You might kick up too much dust, making it hard to breathe.
- ◆ Cover your nose and mouth with a cloth to avoid breathing harmful dust and smoke.
- ◆ To let rescuers know where you are, tap on a pipe or wall. Or you can use a whistle. Avoid shouting since this could cause you to breathe in a dangerous amount of dust.
- ◆ If you have a flashlight, use it to see and to let rescuers know where you are.

3.2 Chemical spills

DEFINITION

Chemical spills and hazards don't just happen in industrial facilities. They can happen in your home, too. Your home is filled with dangerous chemicals, like paints, gasoline, bathroom and kitchen cleaners, old car batteries, and more. If one of these chemicals leaks or spills, your home could become dangerous. Learn more about different chemical and biological hazards.

The following are general guidelines to be followed for a chemical spill.

- ◆ Immediately alert area occupants and supervisor, and evacuate the area, if necessary.
- ◆ If there is a fire or medical attention is needed, contact Public Safety at your local emergency number.
- ◆ Attend to any people who may be contaminated. Contaminated clothing must be removed immediately and the skin flushed with water for no less than fifteen minutes. Clothing must be laundered before reuse.
- ◆ If a volatile, flammable material is spilled, immediately warn everyone, control sources of ignition and ventilate the area.
- ◆ Wear personal protective equipment, as appropriate to the hazards.
- ◆ Consider the need for respiratory protection. The use of a respirator or self-contained breathing apparatus requires specialized training and medical surveillance. If respiratory protection is used, be sure there is another person outside the spill area in communication, in case of an emergency. If no one is available, contact your manager.
- ◆ Protect floor drains or other means for environmental release. Spill socks and absorbents may be placed around drains, as needed.
- ◆ Complete a hazardous waste sticker, identifying the material as Spill Debris involving XYZ Chemical, and affix onto the container. Spill control materials will probably need to be disposed of as hazardous waste. Contact
- ◆ Report all spills to your supervisor

3.3 Fire

DEFINITION

Typically, fire comes from a chemical reaction between **oxygen** in the atmosphere and some sort of **fuel** (wood or gasoline)

If you discover a fire:

- ♦ Alert people in the area of the need to evacuate
- ♦ Activate the nearest fire alarm
- ♦ Call the local fire Department.

If a building fire alarm is sounding or you receive notification of a fire emergency:

- ♦ Feel the door or doorknob to the hallway with the back of your hand. If it feels hot, do not open it, the fire may be on the other side of the door. If you are trapped, put a cloth or towel under the door to help prevent the entry of smoke.
- ♦ Phone the Fire Department and provide them with your location and telephone extension and that you are trapped in the room and need rescue. Stay on the phone until instructed otherwise.
- ♦ If the door is not hot, open it slowly. If the hallway is clear of smoke, walk to the nearest fire exit and evacuate via the nearest stairwell to the street/grade level exit.
- ♦ Close doors behind you.
- ♦ Do not attempt to use elevators. Elevators are tied to the fire detection system and are not available to occupants once the alarm sounds.
- ♦ Assemble at the area designated in your departmental Emergency Action Plan and remain there until instructed by the fire department that it is safe to re-enter the building.

If you have been trained to use a fire extinguisher:

Only trained personnel may use fire extinguishers. Small fires can be extinguished without evacuation, but you must constantly evaluate and be ready to evacuate if the fire cannot be controlled. NEVER ENTER A SMOKE-FILLED ROOM.

- ♦ Alert people in the area.
- ♦ Activate the fire alarm.
- ♦ Smother the fire or use the correct fire extinguisher. Aim the extinguisher at the base of the fire.
- ♦ Maintain an accessible exit.
- ♦ Avoid smoke and fumes.
- ♦ Remain available to answer questions from fire marshal or the fire department.
- ♦ Contact facility management to replace the fire extinguisher.
- ♦ Report all fires to your supervisor.

4. Procedures dealing with intentional threats

If a terrorist attack happens near you, here's what you should do:

- ♦ Always stay calm.
- ♦ Know the facts. Watch the news, listen to the radio, and listen to local officials for news and instructions.
- ♦ Be ready to evacuate.
- ♦ Check to see if you or anyone around you is injured. Phone only if someone is seriously injured and needs immediate medical attention.
- ♦ If the attack happens in or near your work/office, do NOT light matches or candles. Do NOT turn on electrical switches or any appliances. This could spark a fire. Know what to do if a fire is already burning.
- ♦ Check for gas leaks. If you think there is one, find out what to do.
- ♦ Call your emergency contact person to let them know where you are and if you're ok.

4.1 Bomb and bomb threats

If you receive a bomb threat, here are some questions you should ask the caller:

- ♦ Who are you?
- ♦ Where is the bomb right now?
- ♦ When is the bomb going to go off?
- ♦ What does it look like?
- ♦ What kind of bomb is it?
- ♦ Where are you calling from?
- ♦ Why did you place the bomb?

TAKE NOTE

Try to keep the caller on the line as long as possible. Do your best to write down or record the conversation. You should also write down things like the caller's voice and any background noise. The more information you can tell authorities, the better. See example of recording document on the next page.

BOMB THREAT : Action list and questionnaire (This form is completed by the person who receives the call/threat)

Step 1: Remain calm

Keep the informant talking and note the following particulars:

Date: _____ **Time at start of call:** _____

Call received by: _____

Public telephone: YES / NO

Particulars of threat: _____

Where is the bomb? _____

What time will the bomb explode? _____

What does the bomb look like? _____

What is the informants name? _____

Time at the end of the call: _____

Step 2: Make notes of the following as soon as possible after step 1

Voice over the telephone: MAN / WOMAN / CHILD

Estimated age: _____

Behaviour: Exited / Calm / Cross / Emotional / Disjointed

Vocabulary: Excellent / Good / Poor

Speech: Fast / Slow / Defective (Stutter)

Accent: English / Afrikaans / African / Foreign

Background noises: Factories / Machines / Traffic / Aircrafts / Trains/ / Other _____

Office sound: Telephone / Radio / Telex / Other _____

Does the informant have any knowledge of: Personnel / Management / Organizational activities

Did you recognize the voice? YES / NO

Step 3: Inform the supervisor immediately, but nobody else.

4.2 Suspicious package

How do you know if a letter or package is suspicious?

To determine if the letter or package is suspicious, check to see if it has one or more of the following characteristics:

- ◆ It is not addressed to anyone in particular. Or it is addressed to someone who no longer lives or works at that address.
- ◆ The label is handwritten or poorly typed. It may contain typos, misspellings and incorrect information.
- ◆ There is no return address or a strange return address.
- ◆ It says things like "To Be Opened in the Privacy of," "Confidential," "Personal," "Do not X-ray," or "Prize Enclosed."
- ◆ There is more postage on the package or letter than is necessary. Or there's no postage at all.
- ◆ It is hand-delivered by someone who's not an official mail carrier.
- ◆ It is unusually heavy for its size.
- ◆ It has a strange shape or is lopsided.
- ◆ There is an unusual amount of tape on it.
- ◆ It smells funny, is leaking, is a strange color, or has oily stains.
- ◆ There is a strange powder on the outside.
- ◆ It has writing that you don't understand on it.
- ◆ It's wrapped in string. Packages today no longer need to be wrapped in twine or string.
- ◆ You received a phone call from an unknown person asking if the package or letter was received.

You've determined that the letter or package is suspicious. Here's what you should do now:

- ◆ Put it down immediately and carefully.
- ◆ Place it on a stable surface, like a table or the floor.
- ◆ Cover it with trash can or a plastic bag.
- ◆ Phone the 10111.
- ◆ Let others in the building know about the package and tell them to leave the area. If you think you've been exposed to any dangerous materials that might be inside or on the package, try not to go too far from the area. That way, you will hopefully not spread the contamination.
- ◆ If you touched the package, wash your hands with soap and lukewarm water.
- ◆ Remember details. Make a list of all the people who were in the area or room where the letter or package was seen.

4.3 Hostage situations

People are not taken hostage or kidnapped for political reasons only. In some instances transgressors could be caught red-handed in committing an armed robbery and then decide to take people hostage on the spur of the moment.

Behaviour of hostages

- ◆ Do not argue with the people who have taken you hostage.
- ◆ Do exactly as the hostage taker says.
- ◆ Stay calm, as difficult as it may be.
- ◆ Try to convince the hostage takers to allow hostages to move away from windows, entrances and exits. Do this to keep the group of hostages together.
- ◆ Ask permission for hostages to sit down.
- ◆ Hostage takers may be very nervous, do not ask too many favours at one time.
- ◆ The spokesman for the hostages must try to make friends with the hostage takers. This could ease the tension and also lower their guard.
- ◆ If the hostages must talk to each other, inform the hostage takers of the reasons for the conversation. Do not speak too often.
- ◆ Don't try to be a hero, it could be at the expense of the lives of other hostages.
- ◆ If a shooting breaks out, stay down and look for cover. DON'T jump up or try to escape.

[illegible]

STUDY UNIT 3

Emergency planning

LEARNING OUTCOMES

On completion of this study unit the student will....

- ♦ Explain the basic structure of an emergency plan
- ♦ Understand the elements of an emergency plan and explain it against practical examples
- ♦ Know the specific responsibilities of security staff during emergencies .
- ♦ Explain the rules to follow during an evacuation.
- ♦ Complete the required administration documents/registers

1. Introduction

Borodzicz (2005:79) makes a distinction between emergencies, crises and disasters. According to Borodzicz emergencies can be defined as situations requiring a rapid and highly structured response where the risks for critical decision makers can, to a relative degree, be defined. Crises are also situations requiring a rapid response (for this reason they are all too easily misconceived as emergencies). In contrast the risks for critical decision makers here are difficult to define owing to an ill structure in the situation. It is typical for such situations that the effect of the response either is, or appears to be, unclear. A disaster can be defined as a cultural reconstruction of reality. Disaster is distinct from both emergency and crises only in that physically it represents the product of the former. Disasters are the irreversible and typically overwhelming result of ill-handled emergency and crises. Disasters do not cause effects. The effects are what we call a disaster.

According to the Canadian Centre for Health and Safety there is a need for emergency plans as besides the benefit of providing guidance during an emergency one may discover hazardous conditions that would aggravate an emergency. The planning process may also bring to light a lack of resources i.e. equipment, trained personnel etc. The lack of an emergency plan could lead to severe losses and casualties in the event of an emergency and possibly the financial collapse of the organisation.

An emergency plan specifies procedures for handling sudden situations. The objective is to reduce the possible consequences of an emergency by;

- ♦ Preventing fatalities and injuries;
- ♦ Reducing damage to buildings, stock and equipment; and
- ♦ Accelerating the resumption of normal operations.

Plans and preparations for emergencies, whether or not preceded by disasters, provide the ability to respond when something happens. A response requires people and equipment. Despite calls to the police and fire departments, the fact remains that the first response often is by security personnel or other employees, who obviously need to be trained. In this respect seven things need to be remembered when planning training;

- ♦ Since not all disasters are the same, dealing with each of the types most likely to occur may require specialised training and equipment;
- ♦ Training should include the actual use of different kinds of equipment that might be needed in a given situation;
- ♦ Training should not be given only once or infrequently;
- ♦ Certain types of incidents may require training of all employees and not just security personnel. If a contract security company is used own employees must be trained to respond to emergencies;
- ♦ Training must cover both what should be done and what should not be done;
- ♦ All response team personnel should be trained to function in any assigned role; and
- ♦ Training must be given by qualified trainers.

2. Fire risk

According to Fay (2006: 269) dealing with fire emergencies is a collaborative process that involves the manager of the protected property, a fire marshal or inspector. Collaboration can also include professionals representing the safety and risk management disciplines. Criminal and civil liabilities that can arise from a fire emergency place a grave responsibility on the property manager – a responsibility that dictates a prominent role in developing the fire response capability and in leading the fire response effort pending the arrival of the fire department.

According to Purpura (2002: 288) inspections or audits to check on fire hazards are the mainstay of any organisations strategy against fires. Checklists questions include inter alia the following;

- ♦ Are new facility designs and manufacturing processes being submitted to appropriate personnel for fire protection review?
- ♦ Do employees receive periodic training on fire prevention and suppression systems, policies and procedures?
- ♦ What is the condition of fire suppression equipment?
- ♦ Are plant wastes, oily rags, and other combustibles properly disposed of?

The basic purpose of inspections is to uncover deficiencies. Then, corrective action becomes the heart of the inspection prevention strategy. Feedback from inspections helps in planning for strategies against fire losses. An interdisciplinary planning group often is an excellent source for plans. Fire department personnel, architects, engineers, insurance specialists, loss prevention practitioners and other can provide a multitude of ideas. Fire prevention plans requires employers to prepare fire prevention plans to protect workers. The plans are required to include a list of major fire hazards, proper handling and storage of hazardous materials, potential ignition sources and control, fire protection equipment, maintenance, and the names and titles of employees responsible for fire protection.

The following questions serve as additional points to reinforce planning;

- ♦ Are plans carefully analysed, detailed in writing, adequately implemented, and revised to conform to changes?
- ♦ Do employees know what to do in case of fire?
- ♦ Is there adequate training for fire prevention and suppression?
- ♦ Is there a continuing liaison with public service agencies and public utilities?
- ♦ Are first aid and emergency medical services available?
- ♦ Does the entity have adequate insurance coverage?
- ♦ In the event of fire related losses, are contingency plans available? Can production be maintained or restored quickly through establishing alternative sources of equipment and resources?
- ♦ Are high value items separated to avoid large losses?

Some safety strategies can also be considered as part of the fire prevention program namely:

- ♦ Set up smoking and no smoking areas that are supervised, safe, and clearly marked with signs;
- ♦ In smoking areas, provide cigarette butt and match sand urns;
- ♦ When equipment or devices are selected, select those that have been approved by reputable testing organizations;
- ♦ In the use of heating systems, such as boilers, maintain safety when lighting up, during usage, and when shutting down;
- ♦ Examine motors frequently to ensure safe operation and to prevent overheating;
- ♦ Never overload electrical circuits;
- ♦ Maintain lightning protective devices;
- ♦ Employ an electrician who is safety conscious;
- ♦ Prohibit the use of welding equipment near flammable substances or hazardous materials;
- ♦ Watch sparks during and after welding;
- ♦ Train employees to create an atmosphere of safety;
- ♦ Conduct inspections and correct deficiencies; and
- ♦ Ensure fire protection standby for hazardous operations (Purpura 2002:291).
- ♦ There are a lot of different ways to manage and control risks identified. The above serves as a framework for addressing pure risks identified.

3. The basic emergency plan

According to Berger (1979:163) a basic emergency plan should outline the steps involved in a swift, orderly transition from normal to emergency status. It should answer the familiar questions of who, what, when, where and how. It should specifically designate the authority necessary to declare an emergency and to carry out the emergency plan. Specific plans will necessarily vary from each company, but a basic plan should include, at a minimum the following:

- ♦ An emergency command post or centre;
- ♦ An emergency command organization (chain of command);
- ♦ An alarm or warning system;
- ♦ Communications, internally as well as externally;
- ♦ Shut down procedures;
- ♦ Evacuation procedures; and.
- ♦ Provision for medical care and first aid.

4. The command post

Any emergency response should be controlled from a command post. Although it is essential that the command post is in a secure area away from the risk, depending on the scale of the emergency it might sometimes only be the office of the plant manager, or the security office. In larger organizations for example in a mining environment, a permanent emergency command centre will be established. Although it is sometimes necessary to have decentralized emergency command post for areas where the emergency is taking place over a large area, it is still essential that a centralized command post is established to which the others can report. It is important that in all emergency situations that everyone should know where the “nerve centre” is.

As with other aspects of emergency planning there should always be an alternative, or backup in the event the primary location becomes part of the emergency incident. Although the command centre should always be in a secure or protected area, it must be readily accessible to key role players. The command centre should be well equipped with the following resources:

- ♦ Communication facilities (telephones, two-way radio's, public address systems etc); and
- ♦ Essential emergency records,- which is often maintained, including the following;
 - ⇒ Maps and building plans;
 - ⇒ location of utilities;
 - ⇒ list of emergency equipment, supplies and their location;
 - ⇒ organizational chart with names and telephone numbers of key personnel;
 - ⇒ A list of emergency phone numbers for outside agencies;
 - ⇒ Other records essential to the emergency response;
 - ⇒ First aid equipment; and.
 - ⇒ Specialized equipment

(Berger 1979:163-162)

5. Chain of command

Effective response to any emergency is in principal based on a well established chain of command , with the authority and response to act promptly in any crises. The emergency plan should outline the emergency organisation within a company and should give clear mandates to individuals within the chain of command.

Top management: Depending on the size and structure of an organization the administrator of the emergency plan should preferably be a member of top management. The higher the “rank” of the administrator the better the emergency plan will function. The representative from management must have the authority to act and speak on behalf of the company. The administrator, although not always operationally responsible for emergency planning, should ensure that emergency plans are drafted, maintained and implemented. It is also the responsibility of the administrator to liaise with outside agencies and other cooperating companies to ensure that emergency plans are adopted and converted to be in line with national strategies. The representative from management must have the authority to declare a state of emergency, with the subsequent activation of the emergency plan.

A succession list must at all times be available to designate those members of management, in order, who will assume the authority and responsibility in the absence of the indicated person.

Emergency controller: Depending on the size and structure of organisations the representative from top management will sometimes also assume the active command of emergency response. In companies with an extended organisation though the manager directly involved with operations will function as emergency controller. In industrial environments the plant manager is normally the “man -in-charge” when emergencies are declared. According to Mackensie et al. (1983:77) the emergency controller will take overall charge in an actual or potential emergency situation. The person appointed should have the authority, leadership and decision-making abilities. The emergency controller should have at least one deputy, so that the deputy can control an emergency in his absence. Where possible the emergency controller should be a member of the emergency planning group

The emergency controller is responsible for the following:

- ♦ Classifying the emergency and initiating action;
- ♦ Activating emergency teams;
- ♦ Ordering shutdown (partial or full);
- ♦ Ordering evacuation (partial or full);
- ♦ Reporting to management;
- ♦ Making emergency announcements;
- ♦ Requesting aid or other assistance; and.
- ♦ Coordinating emergency actions (Berger 1979:165)

Emergency team: Depending on the type, size and nature of an organisation emergency teams should be clearly designated for each of the aspects of the emergency response. The responsibilities will vary from company to company and team members might be appointed for the following responsibilities:

- ♦ Fire fighting;
- ♦ rescue;
- ♦ first aid and medical care;
- ♦ transportation;
- ♦ communications;
- ♦ security;
- ♦ engineering;
- ♦ maintenance;
- ♦ finance; and.
- ♦ industrial and public relations (Berger 1979:165)

Emergency team leader: The emergency teams should preferably follow the normal organisational chain of command and should be lead by the manager or supervisor of a department. The emergency team leader should have an alternative in the event that he/she is not available to assume the responsibility.

The responsibilities of an emergency team leader consist of the following:

- ♦ Ensure that the team is always at full strength;
- ♦ Responsible for all the administration of the emergency team;
- ♦ Man the emergency phone during an emergency;
- ♦ Keep the emergency “file” updated;
- ♦ Placement and organisation of team members during an emergency situation;
- ♦ Ensure that all emergency equipment is in working condition;
- ♦ Represent the emergency team at emergency coordinating meetings;
- ♦ Ensure, in cooperation with emergency controller, that all team members are trained for their assignments;
- ♦ Ensure that emergency equipment are utilized to protect life and property; and.
- ♦ Assist with the scheduled test of alarms (Du Preez 1990: 362-363).

6. Alarm or warning system

In almost all organisations nowadays , industrial and otherwise, a fire alarm system exist. The systems normally include a local signal (visual and/or auditable) as a warning to personnel, but also as method of communication with the local fire department.

As part of the emergency plan it is essential that an alarm system be incorporated in the emergency procedure, either as communication medium, or as warning system to personnel. In addition to fire alarms, other emergency alarms will usually originate from the emergency command centre, or will be activated on authorization of the emergency administrator/emergency controller. Existing public address systems may be used for emergency announcements and alerts. In some cases a manual alarm or bell is used for all warnings. It is thus essential in any emergency plan that provision is made for a visual and/or audible alarm to inform and warn personnel of emergencies.

Some means should be established to identify fire and other emergency situations by distinctive signals (Berger 1979:166)

7. Communication systems

Any emergency plan should make provision for means of communication, in addition to the alarms as communication medium indicated above. Communication as part of the command centre, internally as well as externally is essential and should be sufficient to handle all incoming and outgoing telephone calls. It should be taken into consideration that the electrical supply, as well as the telephone system might be interrupted during an emergency and therefore alternatives should be sourced. As internal communication medium, two way radio's and even bells might be used depending on the situation. With the ever growing cell phone market the use of cell phones as communication medium internally and externally had dramatically improved and should this be considered as a primary, or alternatively as a secondary communication medium in any emergency plan.

Communication with external sources of response and support is essential in any emergency plan, and communication with the following agencies should be considered:

- ◆ Fire departments;
- ◆ Police;
- ◆ Hospitals;
- ◆ Emergency/ambulance services;
- ◆ Utilities companies (chemical cleanups);
- ◆ Civil defense agencies;
- ◆ Management and key employees not present;
- ◆ Adjacent plants, buildings or firma affected; and
- ◆ Mutual aid sources (Berger 1979:166).

8. Shut down procedures

As part of any emergency procedure provision must be made for shut down procedures, either for the affected area or the entire plant, depending on the circumstances. A detailed shutdown description should form part of the emergency plan and should be focused on a orderly manner in bringing processes to a halt. The detailed procedures should follow the same pattern as normal shutdown procedures for maintenance and other scheduled operations, but should be adapted for the time frames in with emergencies are anticipated to progress. Depending on the emergency and the time available for the shutdown procedure, the procedure should make provision for quick and basic steps to follow in a limited time frame. This might sometimes only allow for basic shutdown operations, and might include:

- ◆ Shutting off power to machines and fans;
- ◆ Shutting off feed lines, gas lines, etc;
- ◆ Closing windows (opening then in the case of a bomb threat);
- ◆ Clearing aisles;
- ◆ Closing valves;
- ◆ Covering anchoring or otherwise protecting equipment;
- ◆ Plugging vents and pipes; and.
- ◆ Shuttering or otherwise protecting doors windows and vents.

Although shutdown procedures should form part of emergency plans it is advisable that operators responsible for equipment and processes be assigned to do the shut down of the processes they are familiar with. Operating personnel may have specific assignments for shutdown, such as shutting down machinery they are responsible for, clearing aisles, taking precautions against fire where flammables are used, etc. Maintenance and engineering personnel, e.g. electricians and air conditioning technicians might be used for their specialized knowledge during shut down procedures.

The security staff will also have special protective responsibilities during shut down, and also play a major role as a supporting function during shutdown (Berger 1979:167)

9. Evacuation

According to Berger (1979: 167) evacuation procedures are one aspect of emergency planning which will be relatively uniform for almost all situations - that is, the same evacuation routes, exits, secondary routes, and assigned assembly points should be used where ever possible. Employees familiar with one evacuation procedure for fire should not be called on to follow a different route or procedure in another emergency, allowing of course for the possibility of routes being blocked, unsafe or otherwise impassable.

To ensure an orderly evacuation, and to avoid flocking in emergency escape routes as well as at emergency exit doors, a standard evacuation procedure is essential. Evacuation procedures in multi story, and multi complex buildings can be problematic, but with well trained emergency teams and standard evacuation procedures in place evacuation should not be a major concern to any emergency controller. To ensure successful, and effective evacuation of a building it is thus essential to inform personnel of the available routes, and actions to be taken during an evacuation.

Golden rules to consider during an evacuation are as follows:

- ♦ Stay calm;
- ♦ Do not run (walk briskly);
- ♦ Keep to the left of emergency escape routes;
- ♦ Assist disabled persons;
- ♦ Do not use lifts;
- ♦ Ladies must remove their high heeled shoes; and
- ♦ Do not flock together and walk in single file.

Assembly points

Once personnel have evacuated a building it is important to go immediately to the indicated assembly points. The assembly point(s) should be carefully decided upon and should be chosen with the goal in mind to provide a safe area where staff can assemble, away from the danger zone.

The assembly points are multi functional, and include the following:

- ♦ to provide emergency teams the opportunity to do roll call and to determine if any personnel is unaccounted for;
- ♦ To ensure stability and order to the evacuation plan;

- ♦ To avoid panic;
- ♦ To treat any injuries; and.
- ♦ To provide a central point of control over the “masses”(Du Preez. et al.1990:371).

10. Specific security responsibilities during emergencies

Specific duties for security officials will largely depend on both the nature of a crisis and the local conditions. Although the list in by no means complete, the following are specific security responsibilities in an emergency and disaster situation:

10.1 Access control

This responsibility can be shared with other role players as part of emergency teams, but generally the function is solely seated with the security component. The task is aimed at keeping record of all persons entering or leaving the facility during the period of an emergency. Taking human nature into consideration security has a major responsibility to ensure that staff do not re-enter the facility before it is declared as safe. In the event of a bomb threat for example, security staff must ensure that the area is cordoned off to avoid unauthorized access to areas which have not been searched and declared safe by police and other professional agencies.

10.2 Traffic control

Security must ensure unrestricted access to the outside emergency services. Security will for example meet the responding emergency services, like the fire brigade, at the access gate and inform them of the location and type of emergency. In some cases, and normally only on request of the emergency services will the security officials escort the emergency services to the location of the incident.

10.3 Protection of property

Physical security becomes an essential duty once a facility has been evacuated. As history has shown, in the aftermath of emergencies and disasters, looting and theft are in the order of the day. In the aftermath of the cyclone Catrina that hit the state of New Orleans in the USA in September 2005, major incidents of looting has been reported. Due to quick evacuation of facilities in certain emergencies valuable items and products are left vulnerable, and is the responsibility solely on the shoulders of the security component to ensure the protection of property.

10.4 Direction and control of personnel

Taking into consideration that safety of persons is one of the major goals of emergency planning it is thus also an important task of the security component to ensure that staff and visitors, depending on the organization, is directed away from danger zones to areas of safety. The role of security staff to ensure order, as well as to avoid panic, can not be underestimated and should be highlighted as part of the training of security officials.

10.5 Direction and control of evacuation procedures.

As indicated previously it is generally accepted that security officials play a leading role in any emergency. Based on this statement it is thus generally accepted that security officials will have a major role to play in the implementation and control of evacuation procedures as a component of emergency plans.

10.6 Assistance in first aid, rescue, fire fighting and other emergency needs.

Security's general protective function in any emergency may involve the provision of medical care, as a first aid response, to injured employees. It is generally accepted that security officials must be equipped and trained to provide an immediate response to basic medical, but also other rescue related emergencies, as a first line of response. It should generally not be expected of security to fulfil an extended medical and rescue function, but only to act as an intermediate response until advanced support arrives, as required by the emergency. The specialized training of security staff as paramedics, as well as rescue specialists is though not uncommon in certain industries in South Africa, especially in the mining sector and other related industries.

10.7 Protection of vital information, documents and records.

Taking the general view that security is normally the last to leave the "ship", a major responsibility is placed on the security component to ensure the protection of information and records. It is essential for the continuation of business, and specifically the un-delayed continuation of normal business activities after the emergency incident, that information and documents are protected as far as reasonably possible.

Although this task should normally be the responsibility of plant managers, or indicated individuals, it is also the task of security officials to ensure the protection of information and documentation. During fire emergencies the closing of fire proof vaults and record rooms by security staff as part of the execution of the emergency evacuation plan can be used as a typical example of one of the tasks of the security component.

10.8 Establish communication with outside agencies

Taking into consideration the commanding role security generally play in emergency situations, the responsibility to establish communications with outside agencies normally also falls within the list of tasks of the security component. The initial response to emergencies and the subsequent communication with affected service providers like the police, ambulance services, fire departments, hospitals and other local law enforcement agencies, is solely the responsibility of the security component. The setting up of, as well as the maintenance of communication structures are therefore aspects that can not be under emphasized (Berger 1979:169-170).

11. Administration requirements

It is important to note that security officers have an administration function to complete when an emergency situation occur.

This function includes reporting protocols and as such documentation needs to be completed.

Your organization will have a detailed operating procedure that needs to be adhered to at all times. For the purposes of the unit standard the following registers/reports will be discussed.

- ♦ **Occurrence book**
- ♦ **Pocket book**
- ♦ **Incident report**

11.1 Occurrence book

An occurrence book is used to record all security related activities that occur during your period of duty.

The following examples of information could be included in the occurrence book:

- ♦ Reporting on and off duty.
- ♦ Crimes committed during your duty.
- ♦ Arrests made.
- ♦ Actions resulting from the arrest.
- ♦ Accidents that occurred during the duty.
- ♦ Damage to property.
- ♦ Special duties that you may have executed.
- ♦ Visits made by supervisors or other staff members.
- ♦ Patrols undertaken - including the time the patrol started and ended and where it was done.
- ♦ Any unusual incidents that occurred.

- ♦ **Complaints received.**
- ♦ Security breaches.
- ♦ Items found.

Keep the following in mind when writing entries into your occurrence book:

- ♦ Number your entries in a chronological sequence starting with one.
- ♦ Ensure the correct date, month and year is recorded in the occurrence book.
- ♦ Make entries in the order in which they occurred and make sure the correct time is allocated to each event.
- ♦ Use black ink to write and red ink to underline. Registers are usually inspected in red ink.
- ♦ Write neatly and legibly.

There are various ways that an occurrence book can be laid out. This will differ from company to company.

Below is an example, which you may adapt to meet the requirements of your company.

Example of an Occurrence book entry

Day of week and date: Monday 2005/08/13			
		NATURE OF OCCURRENCE	
SERIAL No.	TIME		
123	21:00	Fire: A fire broke out at the chemical plant. Mr. Katlego from have been informed. He gave instruction to contact the Sebokeng fire Department. The Fire Department arrived at 21:20 to deal with the situation. No evacuation was necessary as there was no personnel working at that time.	
124	22:05	Mr. Maseko determined that a Mecer laptop was stolen (asset number 4342222) The incident was reported to the SAPS.	
		The SAPS Reference number is SAPS S/Side 123/08/2005. The investigation officer is inspector Botha(012) 321 4333.,	
		Signed: J Ramoba	

11.2 Pocket book

Pocket books are small A-6 books that each security officer must keep with them at all times and are checked by supervisors and management. These books are used to assist the security supervisor to maintain a high standard of control of all staff and to monitor the activities of officers. Any deficiencies in the security system through entries made by his/her staff member should also be followed up. When a pocket book is full, it is handed in and a new one will be issued to the security officer as per company procedure.

The reasons for keeping the pocket book are:

- ♦ Keep records of duty hours on site.
- ♦ Keep notes, orders and instructions.
- ♦ Document items when away from the occurrence book.
- ♦ Record necessary details to use at a later stage.
- ♦ **Complaints and problems**

No personal telephone numbers or scribbling is allowed. You may also not tear out pages of the pocket book. This book is used as an aid to a security officer within the work environment.

Example of Pocket book entry

2005/08/13 21:00	Fire: A fire broke out at the chemical plant. Mr. Katlego from have been informed. He gave instruction to contact the Sebokeng fire Department. The Fire Department arrived at 21:20 to deal with the situation. No evacuation was necessary as there was no personnel working at that time.

11.3 Incident report

The security officer may also record complaints and incidents by writing an incident report out. This report will serve as an investigation tool when an incident needs to be investigated.

INCIDENT REPORT

Day/Night: _____ Date: _____ Time: _____

INFORMANT (Print) Name: _____ Co No: _____

Company: _____ Section: _____

Telephone: _____ Extension: _____

NATURE OF REPORT: _____

Summary: (Remember Who, What, When, Where and How) _____

INCIDENT:

ACTION TAKEN BY SECURITY:

FURTHER ACTION TAKEN:

RECOMMENDATIONS/COMMENTS:

Copy to client:

_____ Date: _____

STUDY UNIT 4

Evacuations

LEARNING OUTCOMES

On completion of this study unit the student will....

- ♦ Explain the different types of evacuations
- ♦ Explain the action that an officer may take when employees refuse to evacuate.
- ♦ Explain the evacuation drills during the event of a fire
- ♦ Discuss general evacuation procedures.
- ♦ Explain the evacuation drill during the event of an bomb threat.
- ♦ Discuss procedures during the event of a medical emergency.
- ♦ Explain a typical standard operating procedure applicable to evacuation.
- ♦ Identify and explain the meaning of emergency signs applicable to emergencies.

1. Types of evacuations

Evacuation normally causes a certain amount of panic. The decision to order an evacuation must be taken with great care. In most instances only a partial evacuation may be necessary.

1.1 Partial Evacuation

This action is necessary where a suspicious object is found or when a specific place was indicated by a person making a bomb threat. It will also be ordered where a fire is localized and can be easily contained. The term partial evacuation means the following:

DEFINITION

Only the area that is affected by the emergency is evacuated. Other areas not affected will not be evacuated. This limits the risk of injury to personnel and the damage to property.

Advantages of partial evacuation

- ♦ The risk of injuries are minimized.
- ♦ Employees are available to effect searching of the area and to assist.
- ♦ Essential services can continue.
- ♦ Employees must remove all personal belongings e.g handbags, lunch boxes, etc.

1.2 General evacuation

The decision to order a general evacuation is a difficult one to take because of the accompanying responsibility and the problems it may cause. The term general evacuation means the following:

DEFINITION

All of the areas that is affected by the emergency as well as those that is not affected is evacuated. The whole company, personnel and visitors will have to evacuate the premises.

Disadvantages of General Evacuation

- ♦ Employees can be injured in the rush to evacuate, particularly if they are not well trained.
- ♦ In the event of a bomb threat the possibility exists that another similar device could be placed outside the building.
- ♦ Employees and supervisors are not available after the evacuation to help search the premises.
- ♦ Loss of production can have an adverse financial effect.

2. Mobility Impaired or Other Impaired Persons During an Evacuation

Persons suffering mobility impairment or other impairment that would impact, or could possibly impact, on their safe and speedy evacuation have a legislative obligation to communicate the nature of the impairment to the emergency team leader or their supervisor prior to any event which may require evacuation.

The emergency team leader should discuss with the individual concerned the procedures to be taken if they are present during an evacuation. In any case, the impaired person should be made aware of the need to evacuate by whatever means is reasonable and effective.

Measures taken to evacuate an impaired person will reasonably be expected to depend on the nature of the impairment and the circumstances of the emergency or evacuation. Assistance may be required in locating and using the normal exits, or the emergency may restrict or negate the ability to use a suitable exit.

Persons with an impairment not affecting their mobility at all, **(e.g. not to do with walking, eyesight, ability to direct themselves)** and once made aware of the need to evacuate, should reasonably be expected to make their own way to the evacuation exits and assembly areas.

Where the impairment of an individual only partially affects their ability to respond to an evacuation **(e.g. impaired vision or the need to use crutches)** and the emergency team leader or supervisor is aware of the situation, an able-bodied person should be nominated to guide or assist the impaired individual to the evacuation exit and assembly area. If those in authority are unaware, they should be notified immediately, or failing the ability to do so, an able-bodied person should assist the impaired person. The evacuation of this individual should not hinder the passage of more able-bodied people, and is more safely conducted after the majority have passed. If possible a 'Buddy System', where both parties have practiced together the response to a call to evacuate, should be considered.

If the mobility restriction is severe **(e.g. the person uses a wheelchair)**, the response to the evacuation call will depend upon the nature of the emergency or evacuation. Where a suitable exit is safely available, the person may prefer to effect their own egress and attendance at an assembly area. If for any reason the exit is unavailable, the individual should be accompanied to a pre-arranged safety point from where, if necessary, their evacuation can be procured, preferably by suitably trained persons. **(e.g. Fire Brigade personnel)** A responsible person should be nominated to assist and remain with the impaired person, and provide comfort and reassurance if needed. A 'Buddy System' should be considered.

TAKE NOTE

At no time should a severely impaired person be exposed to unnecessary distress. Evacuation by carrying should only be considered if there is imminent danger, and other options are not available. This method should be conducted by suitably trained personnel where possible.

3. Refusal to comply with evacuation drills

Under legislation, all persons in the workplace must obey directions given by an emergency team leader during an evacuation or in the conduct of their duties. Failure to do so is a serious offence, and once a person has been clearly advised that they are required to evacuate, the refusal must be reported to the team leader who will advise the Officer-in-Charge of the Emergency Services.

The Officer at their discretion may take the appropriate action under law to remove the person. (Emergency Services personnel are legally able to use whatever means available that is reasonable and necessary in order to ensure the safety of all persons during an emergency or evacuation.) The Officer-in-Charge may lay charges for the breach of law. Similarly, the offence must be reported to the company director/supervisor. Disciplinary actions is dependent on the nature of the offence and at the discretion of the organization.

4. Evacuation drills during the event of a fire

If a fire is discovered, there are three major considerations:

- ♦ raising the alarm,
- ♦ fighting the fire,
- ♦ and evacuating the building.

The priority of these will be determined by the circumstances, but personal safety is paramount at all times. The organizational procedure will be adhered to in all regards.

In the event of a fire, we are all confronted with the decision of whether to fight the flames with an extinguisher or evacuate the building immediately. This is probably the most important decision you will face when a fire breaks out.

When you are not trained in portable extinguisher use, the answer is easy: **you should evacuate, and never attempt to fight a fire if you do not have extinguisher training.** If you are trained with extinguishers, however, there are many things to consider when deciding whether to fight or take flight.

4.1 Questions to Fight By

Ask yourself these questions when determining whether to fight a fire with a portable extinguisher or evacuate the building.

- ♦ **Is the fire small enough to be controlled by a portable extinguisher?** The time to use a portable extinguisher is during the early stages of a fire. Once a fire starts to spread, your best option is to evacuate the building.
- ♦ **Am I safe from toxic smoke and gasses?** Remember that all fires produce carbon monoxide. Carbon monoxide is a colorless, odorless toxic gas. Many fires will produce other toxic gasses in addition to carbon monoxide. If the fire is producing large amounts of smoke, or you suspect the fire involves a hazardous material, your best option is to evacuate the building.

- ♦ **Do I have an escape route?** Before attempting to extinguish a fire, always ensure you have a reliable escape route. If you are in a room or confined area, position yourself between the fire and the exit door. In other words, when you are facing the fire the exit door should be at your back, ensuring you are not trapped if the fire is not quickly extinguished.
- ♦ **Do I have the right extinguisher?** Make sure the extinguisher's label indicates it is rated for use in fighting the type of fuel that is burning, and check if the extinguisher is fully charged. If the extinguisher is not fully charged, or is not the proper type, your best option is to evacuate the building. You can find information about extinguisher ratings in the learning program Basic Fire Fighting.
- ♦ **What do my instincts tell me?** If you do not feel comfortable trying to extinguish the fire, do not attempt to. Evacuate the building and let the fire department do their job. Remember: firefighters have equipment, training, and experience that you do not possess.

4.2 Take Flight

If you do not attempt to extinguish the fire, your only course of action is to evacuate the building. During evacuation you should take the following actions:

- ♦ Evacuate the room and close the door behind you to confine the fire.
- ♦ Activate the fire alarm system to notify building occupants of the emergency.
- ♦ Notify your supervisor and the Fire Department of the fire.
- ♦ Evacuate the building.
- ♦ Remain outside until notified by the fire department the building is safe to re-enter

4.3 Immediate action drills for evacuations

For the person discovering the fire:

A. Extinguish only if you can do so safely and quickly.

B. If the fire cannot be extinguished:

- ♦ Confine the fire by closing the doors.
- ♦ Activate (pull) the nearest fire alarm, if there is one.
- ♦ Call the Fire Department
- ♦ Alert others.
- ♦ Meet the Fire Department when they arrive.

For occupants of the building:

- ♦ Close the doors to your immediate area.
- ♦ EVACUATE the building via the nearest exit.
- ♦ Assist others in exiting the building.
- ♦ DO NOT use elevators.
- ♦ Avoid smoke filled areas.

For persons evacuating from the immediate fire area:

- ♦ Feel door from top to bottom. If it is hot DO NOT proceed; go back.
- ♦ If door is cool, crouch low and open the door slowly.
- ♦ Close door quickly if smoke is present so you do not inhale it.
- ♦ If no smoke is present, exit the building via the nearest stairwell or exit.
- ♦ If you encounter heavy smoke in a stairwell, go back and try another stairwell.

4.4 Evacuation procedures

When an evacuation of a Section is initiated by an employee, the procedure is as follows:

- ♦ Direct employees/visitors to the nearest exit as quickly and calmly as possible.
- ♦ Check toilets and other areas for stragglers.
- ♦ Report to the Emergency team leader and act on any instructions.

Assembly Area procedures

As far as possible all staff/visitors should remain in the assembly area until the situation is stabilized.

Staff conducting searches of toilets etc. must report their findings to the emergency team leader. (area clear or otherwise – mobility impaired persons locations)

Under no circumstances should staff members be permitted to go back into the building for any reason, until advised safe to do so.

In an evacuation the following points should be borne in mind:

- ♦ Arrange assistance for handicapped persons;
- ♦ Secure cash and valuable documents (if safe to do so);
- ♦ Evacuate with a minimum of personal material.
- ♦ In a bomb threat situation take all your personal material.
- ♦ Where possible close doors and windows on departure; In a bomb threat situation open all doors and windows.
- ♦ Prevention of panic is of paramount importance;
- ♦ Obey directions given by emergency services personnel.
- ♦ Keep all exits / entrances clear at all times.
- ♦ Do not allow anyone except Emergency Services personnel to re-enter the building while the alarm is sounding.

5. Evacuation drills during the event of a bomb threat

Until proven otherwise, all threats are to be treated as real. During working hours the emergency team together with management staff should evaluate the threat and consider actions/evacuation. This may be done in conjunction with the police and facilities management staff if they are available. See study unit 2 for example of a bomb threat checklist.

The threat may be specific or non-specific as follows:

Specific Threat: In this case the caller will provide a more detailed warning statement, which might describe the type and placement of device, the reason or motive and /or other additional specific information.

Non specific threat: In this instance they may make a simple statement to the effect that a device has been placed. Generally very little, if any, additional detail is conveyed before the caller terminates the conversation. The non-specific threat is more common, but neither type of threat can be immediately discredited without investigation. Every threat has to be treated as real until proven otherwise. Depending on the evaluation by management, one of four possible alternatives should be pursued. If an evacuation is ordered, do not use fire alarm – use PA facility and a search along paths of travel and around assembly areas must be conducted before ordering evacuation.

5.1 Evacuation action

- ♦ **Option One:** Do nothing. It may be tempting to do nothing when a child or drunkard has made a threat but if the slightest doubt another option must be considered.
- ♦ **Option Two:** Search with partial evacuation. If the threat level is considered moderate, with no reason to believe explosion is imminent, the person who has a knowledge might consider partial evacuation retaining only essential staff and search teams. Partial evacuation might also be appropriate where an organisation is spread over a wide area: Only those personnel at immediate risk may need to be evacuated initially.
- ♦ **Option three:** Search and evacuation. In this option personnel remain in-situ during initial search and are evacuated once the presence of a suspicious article is confirmed. Normally this option would be adopted in a low threat assessment scenario because otherwise the implication is that persons would be exposed to the effects of a device if it functioned. Doors and windows should be left open and staff and students should be required to remove all personal belongings, e.g. handbags, brief cases, etc..when evacuating. This will facilitate the identification of suspect objects.

- ♦ **Option Four:** Evacuate immediately. When the risk is high or when search is precluded due to the extreme short notice of the threat, the person who has the knowledge has no option other than to evacuate as quickly and as safely as possible. If the decision to evacuate without a search is made then the following points must be considered:
 - ⇒ **Risk of injury.** As a general rule, the easiest area in which to plant an object is in the shrubbery which is sometimes found outside a building; an adjoining car park or an area to which the public has the easiest access. Immediate evacuation through these areas might increase the risk of injury and car parks should not normally be used as assembly areas.
 - ⇒ **Panic.** A sudden bomb threat evacuation may cause unpredictable behaviour, leading to unnecessary risk of injury.
 - ⇒ **Re-occupation.** Total and immediate evacuation, whilst risky, is the easy decision. After taking the easy way, the hard decision of when to return has still to be made.

5.2 Search

The aim of the search is to identify any object which is not normally found in an area or location; for which an owner is not readily identifiable or which becomes suspect for any other reason, (e.g.) the object is similar to that described in the threat. **It should NOT be assumed that local police will conduct bomb searches.**

5.3 Suspect object found

The aim of the search personnel should not touch or move it but should advise the police immediately. Search of other areas should be continued to ensure that there are no other suspect objects. Be aware of secondary entrapment devices.

- ♦ If nothing has occurred after a minimum of 20 minutes past the threatened detonation time or one hour after the phone call, then the Management will have to consider undertaking a complete search of the building before proposing re-occupation.
- ♦ Do not allow anyone to enter a bomb threatened building unless it has been authorized by the emergency team leader.

The general evacuation procedures and drills remain the same for all other emergencies.

6. Medical support

Emergencies of a medical nature need not involve more than one victim. Your actions during the crucial first minutes following serious injury can save lives. The following should be your priorities until help arrives:

- ♦ Summon Emergency Medical Help, Police officers will be dispatched, the Health Clinic will be dispatched and an ambulance requested. Stay with the victim while someone else calls for help.
- ♦ **Breathing:** If necessary, begin mouth-to-mouth breathing which is explained in the program "Conduct basic first aid."
- ♦ **Circulation:** Check for a pulse. If no pulse, begin CPR (if knowledgeable).
- ♦ **Bleeding:** Apply direct pressure and elevation to stop persistent bleeding. Use the cleanest cloth you can find.
- ♦ **Neck or spinal injuries:** Do not move victim unless absolutely necessary.
- ♦ **Other health problems:** Check victim for emergency medical ID tags and/or medications. When medical help arrives turn this information over to them.
- ♦ **Do not give food or liquids:** An unconscious or semi-conscious victim cannot swallow and could suffocate.
- ♦ **STAY CALM:** Reassure the victim and stay calm yourself.

TAKE NOTE

.....
All citizens have human rights. These rights need to be looked at.

The rights to life (section 11)

Everyone has the right to life.
.....

6.1 Victim support

People can suffer greatly in the aftermath of crime and may experience a range of reactions, depending on the severity of the crime. These may include:

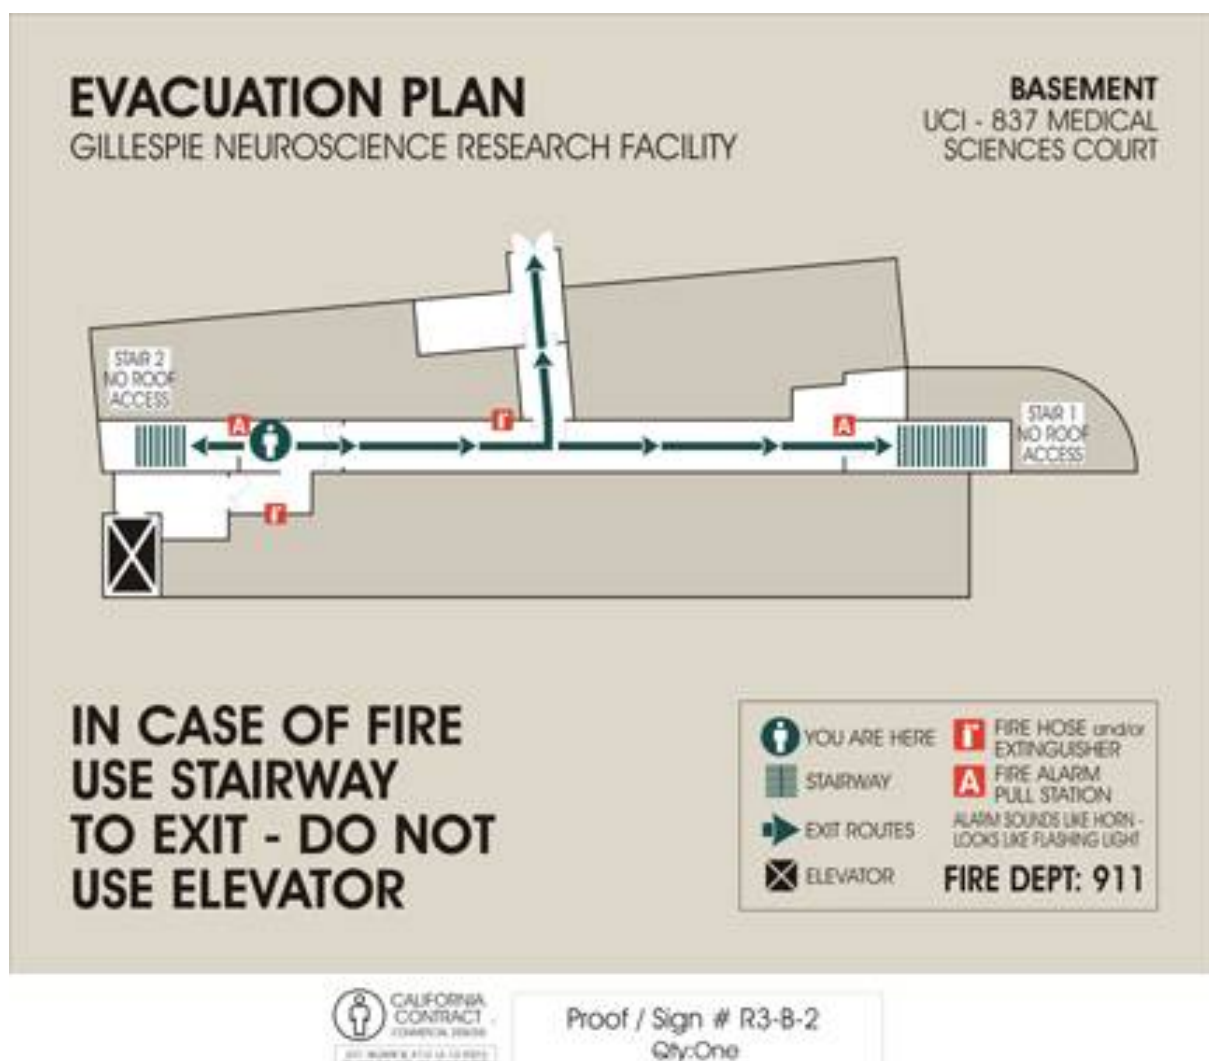

- ♦ headaches,
- ♦ insomnia,
- ♦ anxiety,
- ♦ relationship problems
- ♦ and a temporary inability to cope with every day living.

These are all normal reactions following a crime, however some people may need help to deal with them.

The emergency team leader will arrange assistance for support.

This is only an example of a work instruction to respond to emergencies. Please note that the instructions of each company and or security site will be different.

- ◆ **Step 1:** Identify type/nature of emergency.
- ◆ **Step 2:** Determine seriousness of emergency.
- ◆ **Step 3:** Determine immediate threat.
- ◆ **Step 4:** Respond to the emergency according to the site Emergency Preparedness Plan.
- ◆ **Step 5:** Stabilize the situation, if possible.
- ◆ **Step 6:** Report immediately to Manager/Supervisor, and Site Manager/Supervisor.
- ◆ **Step 7:** Make an entry in the Occurrence Book.

8. Emergency Signals

In the event of an evacuation employees should adhere to the following signals. The signals will indicate assembling points, fire exits etc..

Disabled fire exit arrow right

Disabled fire exit arrow down right

Fire exit arrow down

Fire exit arrow up

Fire exit arrow down
left sign

Fire exit arrow up right
sign

Fire exit arrow up sign

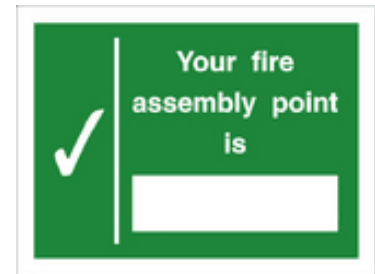

Fire exit straight
arrow sign

Fire exit diagonal

Example of an emergency plan with evacuation routes

This image shows a blank sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

WORDS/ACRONYMS	EXPLANATION OF ACRONYMS
ASSESSMENT	"A structured process of gathering evidence and making judgments about an individual's performance in relation to registered national standards and qualifications"
ASSESSMENT CRITERIA	It describe the evidence that is needed to show that the learner has demonstrated the outcome correctly. A list of evidence to be supplied by the candidate as proof of his / her ability to integrate all of the competencies listed earlier in the standard.
COMPETENCE	Competence is the ability to do certain things in a range of different environments with knowledge and understanding about what is being done and the effect this has on others. It includes <u>Knowledge, skills, attitudes, values and ethics.</u>
CREDIT	Each unit standard is worth a number of credits which gives an indication of the size and scope of the unit standard, the standard is worth. (1 credit = 10 notional hours of learning)
CRITICAL CROSSFIELD OUTCOMES	Critical cross field outcomes are to direct educational activities towards development of the learners within a social and economic environment.
EMBEDDED KNOWLEDGE	Body of theory essential for understanding and applying the standard. Principles, methods and techniques that would underpin good practice of this unit standard.
EVIDENCE	Evidence is a set of information or observations that provides proof of the learner's competence.
FORMATIVE ASSESSMENT	Aims to assist the learner to identify any knowledge/skills gaps when demonstrating his/her current competence. Diagnostic assessment supports learning and progress of the learner.
INTEGRATED ASSESSMENT	Integrated assessment refers to: • assessing a number of outcomes together • assessing a number of assessment criteria together • assessing a number of unit standards together • using a combination of assessment methods and instruments for an outcome/s • collecting naturally occurring evidence in the workplace • Acquiring evidence from other sources such as supervisor's reports, testimonials, portfolio of work previously done, logbooks, journals etc.
LEARNING ASSUMED TO BE IN PLACE	Building blocks (knowledge, skill and understanding) assumed to be in place
LEARNING PROGRAM	A "learning program is a set of learning activities in which the learner will be involved in working towards the achievement of one or more outcomes.
LEVEL	Each unit standard is registered on the NQF at a particular level based on the complexity of the outcomes and stringency of the standards.
NQF	National Qualifications Framework
RANGE STATEMENTS	The range statements indicate detailed requirements of the assessment criteria.

RE-ASSESSMENT	• The same method and instrument may be used, but, the task and materials should be different • The task and materials should, however, be of the same complexity and level as the previous ones. • In case the methods and instruments are changed it must be ensured that they are appropriate for the outcomes specified.
RPL ASSESSMENT	RPL is a way of recognizing what individuals already know and can do. The basic premise underlying it is that people, especially mature adults, learn many things inside and outside the formal structures of education and training and that irrespective of where, how and when learning was acquired, subject to assessment, it can be worthy of recognition and credit.
RPL	Recognition of prior learning
SASSETA	Safety & security sector education and training authority.
SAQA	SOUTH AFRICAN QUALIFICATION AUTHORITY
SPECIFIC OUTCOMES	An outcome is a statement that describes the required competency that must be demonstrated by the learner on successful completion of a training intervention. Key performance areas in the standard are given, the focus is <i>not</i> only on current competence, but also on future competence in this standard.
SUMMATIVE ASSESSMENT	Assessment used to record the level of competence achieved by a learner over a period of time, e.g. at the end of a program, term or year.
QUALIFICATIONS	Represent a planned combination of learning outcomes which has a defined purpose and intended to provide learners with applied competence and a basis for further learning
UNIT STANDARDS	the “building blocks” of qualifications. All qualifications are plotted on the National Qualifications Framework (NQF). “A statement of the outcomes that the learner must achieve to earn credit. Standards are nationally agreed and internationally comparable.”

PURPOSE OF THE UNIT STANDARD

The person credited with this unit standard will be able to identify and determine the type of an emergency and assist with the evacuation of people during the emergency. The person will also be able to respond to and use emergency signals within their own area of responsibility.

The qualifying learner will be capable of:

- Identifying the emergency situation.
- Assisting with an evacuation drill.
- Responding to emergency signals in own area of responsibility.

LEARNING ASSUMED TO BE IN PLACE AND RECOGNITION OF PRIOR LEARNING

- Communication at NQF Level 3.
- Mathematical Literacy at NQF Level 3.

UNIT STANDARD RANGE

Emergency signals may include but are not limited to:

- Alarm, silent panic, duress, telecomm, medial, fire.

UNIT STANDARD OUTCOME HEADER

N/A

Specific Outcomes and Assessment Criteria:**SPECIFIC OUTCOME 1**

Identify the emergency situation.

ASSESSMENT CRITERIA**ASSESSMENT CRITERION 1**

The nature of the emergency is identified to inform further action.

ASSESSMENT CRITERION 2

The emergency is prioritised and graded in order to determine evacuation drills and or emergency signals to be used.

ASSESSMENT CRITERION 3

Information regarding the emergency is collated for relaying purposes.

ASSESSMENT CRITERION RANGE

Relaying purposes includes the referral to the designated responsible individual.

ASSESSMENT CRITERION 4

Continued threat and risk assessments are conducted in own area of responsibility.

ASSESSMENT CRITERION 5

Crime reduction information is collated in accordance with confidentiality guidelines and procedures.

SPECIFIC OUTCOME 2

Assist with an evacuation drill.

ASSESSMENT CRITERIA**ASSESSMENT CRITERION 1**

Emergency and non-emergency signals and incidents are responded to in accordance with workplace procedures.

ASSESSMENT CRITERION 2

Confrontations during an evacuation drill are dealt with in accordance with proportionality of force principles.

ASSESSMENT CRITERION RANGE

Confrontations refer to both: potentially lethal and non-lethal confrontations.

ASSESSMENT CRITERION 3

Manners in which to provide victim support are explained in line with legal prescripts.

ASSESSMENT CRITERION RANGE

Legal prescripts include but are not limited to Chapter Two: Bill of Rights in the South African Constitution.

ASSESSMENT CRITERION 4

Emergency services and official institution liaison are identified for actioning according to contingency plans.

ASSESSMENT CRITERION 5

Administrative requirements pertaining to emergencies are described in terms of reporting functions and their influence on the criminal justice system.

ASSESSMENT CRITERION RANGE

Administrative requirements could include but are not limited to: report completion, giving evidence in court.

SPECIFIC OUTCOME 3

Respond to emergency signals in own area of responsibility.

ASSESSMENT CRITERIA**ASSESSMENT CRITERION 1**

Physical responses to emergency signals and or incidents are explained in terms of their influence on the safeguarding of assets.

ASSESSMENT CRITERION RANGE

- Physical responses may include but are not limited to: movement and approach, techniques on approaching, premises, buildings and rooms.
- Assets include but are not limited to the public, clients, public and client property.

ASSESSMENT CRITERION 2

Emergency signals are reacted to in accordance with standard operating procedures and within the required time frame.

UNIT STANDARD ACCREDITATION AND MODERATION OPTIONS

- An individual wishing to be assessed (including through RPL) against this Unit Standard may apply to an assessment agency, assessor or provider institution accredited by the relevant ETQA, or an ETQA that has a Memorandum of Understanding with the relevant ETQA.
- Anyone assessing a learner against this Unit Standard must be registered as an assessor with the relevant ETQA or with an ETQA that has a Memorandum of Understanding with the relevant ETQA.
- Any institution offering learning that will enable achievement of this Unit Standard or assessing this Unit Standard must be accredited as a provider with the relevant ETQA or with an ETQA that has a Memorandum of Understanding with the relevant ETQA.
- Moderation of assessment will be conducted by the relevant ETQA at its discretion.

UNIT STANDARD ESSENTIAL EMBEDDED KNOWLEDGE

- Use and maintenance of emergency equipment.
- Emergency techniques (search, fire fighting, first aid, recognition procedures, radio and telephone procedures).
- Differences between emergency and non-emergency situations.
- Police and emergency services and structures.
- Risk and threat assessment procedures.

UNIT STANDARD DEVELOPMENTAL OUTCOME

N/A

UNIT STANDARD LINKAGES

N/A

Critical Cross-field Outcomes (CCFO):**UNIT STANDARD CCFO IDENTIFYING**

Identify and solve problems related to the prioritising/grading of emergencies and safety incidents.

UNIT STANDARD CCFO ORGANISING

Organise oneself and one's activities so that the safe, calm and orderly evacuation of people is conducted.

UNIT STANDARD CCFO COLLECTING

Collect, organise and critically evaluate information related to the emergency in order to prioritise the information correctly.
